This presentation begins with a brief overview and definitions of Autism Spectrum Disorders (ASD) and presentation of a large epidemiological study of the disorder. This study, based on the Autism Spectrum Rating Scale (Goldstein & Naglieri, 2009) standardization and validity samples, provides important insights into the nature of ASD. These data as well as data from other research sources demonstrate a changing pattern of core symptoms in autism. The presentation will include examination of the structure of the ASRS (both full and short forms), reliability and validity studies, interpretation, treatment planning / effectiveness, and online administration methods. The new DSM5 scale and the new version of the ASRS for evaluating students with limited language skills will be discussed. Current information will be provided concerning the most widely used and well developed instruments to help diagnose autism. A model for the integration of ASRS and cognitive assessment data for differential diagnosis of ASD and ADHD, as well as an explicit discussion of how to use results from the ASRS for treatment planning and monitoring effectiveness of interventions will be described.
